AS 3850.1 Part 1: General requirements. AS 3850.2 Part 2: Building construction. The new Standard is long overdue as the 2003 version was becoming irrelevant. The 2003 Standard was written primarily for the construction of concrete buildings using 'tilt-up' panels cast horizontally on site and does not apply to precast concrete members such as columns, beams, flooring and facades.

The revised version of AS 3850 will be named Prefabricated concrete elements. The new version has a much wider reach than the 2003 version - which primarily sought to regulate activities associated with site cast tilt-up panels. The revised Standard will apply to all prefabricated concrete elements used in building and construction.

This guidebook is a practical and essential tool providing everything necessary for structural design engineers to create detailed and accurate calculations. Basic information is provided for steel, concrete and geotechnical design in accordance with Australian and international standards. Detailed design items are also provided, especially relevant to the mining and oil and gas industries. Examples include pipe supports, lifting analysis and dynamic machine foundation design. Steel theory is presented with information on fabrication, transportation and costing, along with member, connection, and anchor design. Concrete design includes information on construction costs, as well as detailed calculations ranging from a simple beam design to the manual production of circular column interaction diagrams. For geotechnics, simple guidance is given on the manual production and code compliance of calculations for items such as pad footings, piles, retaining walls, and slabs. Each chapter also includes recommended drafting details to aid in the creation of design drawings. More generally, highly useful aids for design engineers include section calculations and force diagrams. Capacity tables cover real-world items such as various slab thicknesses with a range of reinforcing options, commonly used steel sections, and lifting lug capacities. Calculations are given for wind, seismic, vehicular, piping, and other loads. User guides are included for Space Gass and Strand7, including a non-linear analysis example for lifting lug design. Users are also directed to popular vendor catalogues to acquire commonly used items, such as steel sections, handrails, grating, grouts and lifting devices. This guidebook supports practicing engineers in the development of detailed designs and refinement of their engineering skill and knowledge.

Written by an architect with many years' experience in practice and teaching, this book is a well-illustrated introduction to the great range of materials used in much of the world's building and construction. It is the only book of its type on the market, and suitable for anyone teaching or studying for building trades, architecture, building, landscape design, structural engineering, and allied disciplines. When first published, a reviewer commented, "This book has filled a large gap in publications available to both students and the building professions." The Fourth (2009) Edition is now available, incorporating many references to current standard codes, research, manufacturers, and other authoritative information on the internet, to expand content further if needed.

What determines whether complex life will arise on a planet, or even any life at all? Questions such as these are investigated in this groundbreaking book. In doing so, the authors synthesize information from astronomy, biology, and paleontology, and apply it to what we know about the rise of life on Earth and to what could possibly happen elsewhere in the universe. Everyone who has been thrilled by the recent discoveries of extrasolar planets and the indications of life on Mars and the Jovian moon Europa will be fascinated by Rare Earth, and its implications for those who look to the heavens for companionship.

This international handbook is essential for geotechnical engineers and engineering geologists responsible for designing and constructing piled foundations. It explains general principles and practice and details current types of pile, piling equipment and methods. It includes calculations of the resistance of piles to compressive loads, pile group

Assemblies Cost Data is used by construction professionals for quick and accurate estimating of square foot costs and verification of unit price estimates. It provides thousands of building assembly and component costs. With accompanying drawings, explanations, and component breakdowns that can quickly estimate a building's square foot cost and compare price alternatives. It contains separate reference aids with code requirements to assist in budgeting any job or in checking a unit price estimate or subcontractor proposal.

Companies live or die on the basis of estimating their costs. Preparing estimates and bidding for new jobs is a complex and often costly process. There is no substitute for on the job training -- until now. Drawing on the authors' combined experience of more than 70 years, Estimating Building Costs presents state-of-

the-art principles, practices, and techniques for assessing these expenditures that can be applied regardless of changes in the costs of materials, equipment, and labor. The book is an efficient and practical tool for developing contracts or controlling project costs. The authors cover the major components of the direct cost: estimating procedures and cost trends related to materials, construction equipment, and skilled and unskilled labor. They describe various types of building estimates encountered during the lifecycle of a project, as well as the role and accuracy of each. The book provides an overview of the industry, cost indexes in use, approaches to preparing a detailed estimate, and an in-depth description of the organization and function of the estimating group. Including CSI Master Format and UniFormat codes, estimating forms, a list of available estimating software packages, a detailed construction site and investigation report, the book provides a cost estimating methodology that readers can tailor to their own organizational needs.
