Food Webs in Caves | SpringerLink

Phototrophs in caves have an impact on litholysis and lithogenesis. Biocalcified formations include calcified plant thalli, diverse forms of tuffaceous stalactites and stromatolitic stalagmites. Sun-illuminated dry and submerged cave entrances including cenotes, ice caves and lava tubes are generally understudied. In comparison to phototrophic ...

Cave organisms are the 'monsters' of the underground world and studying them invariably raises interesting questions about the ways evolution has equipped them to survive in permanent darkness and low-energy environments.

Undertaking ecological studies in caves and other subterranean habitats is not only challenging because they are difficult to access, but also because the domain is so ...

low temperature, high humidity, and oligotrophic organisms due to its relatively closed and strongly zonal environments. Up to now, 1626 species in 644 genera of fungi have been reported from caves and mines worldwide. In this study, we investigated the culturable mycobiota in karst caves in southwest China. In total, 251 samples from thirteen caves ...

The caves are located in the Moravian Karst, one of the most significant Devonian limestone regions in Eastern Europe. Over thousands of years the Sloup Stream and the White-Water Stream merged and formed the underground Punkva River.

Read Book Caves Link Springer

This river molded and shaped the soft limestone rock and created the remarkable underground network.

Punkva Caves and the Doctor Who Wouldn't Give Up | Ancient ...

The caves, one of the largest in the country, at an elevation of about 705 m (2,313 ft), distinctly exhibit a variety of speleothems ranging in size and irregularly shaped stalactites and stalagmites. The caves are basically karstic limestone structures extending to a depth of 80 m (260 ft), and are considered the deepest caves in India.
