Enthalpy Change Answers

The enthalpy change for a reaction can be calculated using the following equation:  $Q = mc\Delta T$  /  $Q = \Delta H$  /  $(\Delta H)$  is the enthalpy change (in kJ or kJ mol<sup>-1</sup>) c is the specific heat

## 3.2.1. Enthalpy changes

Enthalpy is given the symbol  $H$

Enthalpy change refers to the amount of heat released or absorbed when a chemical reaction and it is given the symbol  $\Delta H$  A reaction is exothermic when it releases energy, and  $\Delta H =$

# Read Online Enthalpy Change Answers

negative. A reaction is defined endothermic when it absorbs energy, therefore the  $\Delta H = \text{positive}$ .

Enthalpy Changes | A-Level Chemistry  
Revision Notes

Chemists call this energy change as

*Page 17/37*

# Read Online Enthalpy Change Answers

the enthalpy change of the reaction.

Exothermic reactions have a negative enthalpy change, that is they transfer energy to their surroundings.

Endothermic reactions have a positive enthalpy change, that is they take in energy from their surroundings.

## Enthalpy Change - Chemistry A-Level Revision

The most basic way to calculate enthalpy change uses the enthalpy of the products and the reactants. If you know these quantities, use the

# Read Online Enthalpy Change Answers

following formula to work out the overall change:  $\Delta H = H_{\text{products}} - H_{\text{reactants}}$  The addition of a sodium ion to a chloride ion to form sodium chloride is an example of a reaction you can calculate this way.
