'Bretherick' is widely accepted as the reference work on reactive chemical hazards and is essential for all those working with chemicals. It attempts to include every chemical for which documented information on reactive hazards has been found. The text covers over 5000 elements and compounds and as many again of secondary entries involving two or more compounds. One of its most valuable features is the extensive cross referencing throughout both sections which links similar compounds or incidents not obviously related. The fifth edition has been completely updated and revised by the new Editor and contains documented information on hazards and appropriate references up to 1994, although the text still follows the format of previous editions. Volume 1 is devoted to specific information on the stability of the listed compounds, or the reactivity of mixtures of two or more of them under various circumstances. Each compound is identified by an UPAC-based name, the CAS registry number, its empirical formula and structure. Each description of an incident or violent reaction gives reference to the original literature. Each chemical is classified on the basis of similarities in structure or reactivity, and

Appendices include a fire related data table for higher risk chemicals, indexes of registry numbers and chemical names as well as reference abbreviations and a glossary.

This manual captures and summarizes the key elements in management of groin pain, including relevant anatomy, etiologies, diagnostic evaluation tools, imaging, detailed pharmacologic options, interventional modalities and options for operative remediation. The manual separately addresses the management of intrinsic groin pain due to primary disease processes and secondary groin pain due to a prior operation. Current practices, trends in the field, treatment approaches and controversies are addressed. While the primary audience of this book will be general surgeons performing hernia operations and pain management specialists to whom they refer, the SAGES Manual of Groin Pain will serve as a stand alone state-of-the-art resource for all providers who deal with this diagnosis, including primary care providers, sports medicine specialists, gynecologists, urologists, orthopedists, neurologists, physical medicine and rehabilitation specialists, radiologists, physical therapists, industry personnel and importantly, patients who suffer from groin pain who have copious access to health information, but without the filtering, expertise and context provided by the contributors to this manual. This volume also uniquely provides its audience with narrative first-person accounts of some of the most common and challenging causes of pain, so that others can learn from their presentation, pitfalls, successes and failures. The expertise compiled in this manual will give the readership a pragmatic foundation to optimize the diagnosis and management of our patients with this challenging problem.

Using Science to Improve the BLM Wild Horse and Burro Program: A Way Forward reviews the science that underpins the Bureau of Land Management's oversight of free-ranging horses and burros on federal public lands in the western United States, concluding that constructive changes could be implemented. The Wild Horse and Burro Program has not used scientifically rigorous methods to estimate the population sizes of horses and burros, to model the effects of management actions on the animals, or to assess the availability and use of forage on rangelands. Evidence suggests that horse populations are growing by 15 to 20 percent each year, a level that is unsustainable for maintaining healthy horse populations as well as healthy ecosystems.

Promising fertility-control methods are available to help limit this population growth, however. In addition, science-based methods exist for improving population estimates, predicting the effects of management practices in order to maintain genetically diverse, healthy populations, and estimating the productivity of rangelands. Greater transparency in how science-based methods are used to inform management decisions may help increase public confidence in the Wild Horse and Burro Program.
