In terms of hydrodynamic regime, two significantly different hydrodynamic conditions were revealed in response to differences in the incident wave energy. Under low wave energy the tidal currents are dominant; however, flow reversal appears under higher energy conditions (Pope, 1997).

Hydrodynamics Hydrodynamics is a common application of CFD and a natural extension of Dynamiq's core aerodynamic expertise. CFD allows the steady-state and transient hydrodynamics of hydrofoils, submersible vehicles, propellers, impellers, marine structures and marine plant to be computed with extremely high levels of accuracy.

Hydrodynamic devices use convection to enhance the rate of mass transport to the electrode and can offer advantages over techniques which operate in stagnant solution. The addition of convection to the cell usually results in increased current and sensitivity in comparison to voltammetric measurements performed in stagnant solution.

Hydrodynamic slugs are formed by growing of waves on the gas-liquid interface in the stratified flow under certain flowing conditions, where the amplitude of these waves becomes sufficiently large and they can bridge the pipe. Hydrodynamic (normal) slugs tend to be longer, the pipe can, unfortunately, be thousands of feet long.
