The MIG welding process is based on the principle that a consumable metal electrode is used to produce an arc in between the metal electrode and the workpiece. The arc so produced creates a large amount of heat and this heat is used to join the two metal pieces together. Mig Welding

Metal Inert Gas (MIG)

welding is an arc  
welding process that  
uses a continuous solid  
wire electrode heated  
and fed into the weld  
pool from a welding  
gun. The two base  
materials are melted  
together forming a join.

The gun feeds a shielding gas alongside the electrode helping protect the weld pool from airborne contaminants.

GMAW (Gas Metal Arc Welding), is a welding process that is now widely used for welding a variety of materials, ferrous and non ferrous. The essential feature of the process is the small diameter electrode wire, which is fed continuously into the arc from a coil.
