This well-illustrated handbook provides answers to important questions that may arise during the retrieval of multiple organs for transplantation and offers step-by-step descriptions of current surgical techniques for procurement of the various thoracic and abdominal organs, including heart, lung, liver, intestine, pancreas, and kidney. The coverage includes detailed instruction on liver splitting techniques and on living donor liver hepatectomies and laparoscopic and robot-assisted nephrectomy for transplantation. In addition, guidance is provided on preoperative evaluation for multiorgan donation, contraindications, management for organ retrieval in deceased donors, and organ preservation. The advice offered and the questions addressed will be of relevance not only to transplant surgeons, trainees, and fellows but also to all other professionals involved in organ transplantation, including nursing staff in intensive care units and emergency rooms.

Advances in the science of immunology have improved the success rate of organ transplantations since the mid twentieth century. Organ transplantation is now a lifesaving medical procedure for thousands of patients around the world with end-organ diseases. The lifesaving potential of transplantation has been limited by the number and quality of appropriate organ donors. The evolution of brain death criteria by the Harvard Ad-Hoc Committee Report has opened the door to understanding the importance of medical, legal and ethical challenges of organ donation in support of the growth of the transplant science. The possibility of organ donation from living donors has enhanced organ availability for patients with kidney failure. Modern inotropes and immunosuppression regimens have been critical to the success of other organ transplant procedures. However, the cornerstone of successful transplantation continues to be the appropriate selection, evaluation, preservation of organ tissues and the successful surgical procurement process to mitigate the impact of tissue ischemia and reperfusion. In this textbook, the art and science of organ donation and tissue preservation is examined. Through this authoritative text by leaders in the field, the editors provide a state of the art review of modern preservation techniques, patient selection and screening criteria, as well as best practices for multi-organ procurement. Information presented in the book will familiarize readers with the initial steps of determining organ availability which ultimately enables health care professionals to realize the extraordinary potential of successful multi-organ transplant procedures. This guide is intended to be a fundamental resource for students, residents, faculty and staff for all disciplines allied to health care delivery and organ donation.

Organ procurement is an essential step for organ transplantation, from which a quality organ is received for subsequent transplantation. As the demand for organ transplantation continues to grow, multi-organ donation including the heart, lung, live, pancreas, kidneys, and small intestine from one potential donor is always a priority to meet the demand. The donor is generally rigorously assessed for suitability of organ donation prior to proceeding to organ procurement. The quality of the organ from multi-organ procurement is usually satisfactory without jeopardizing its transplantation. In this chapter, the surgical technique for procurement of the organs from the abdomen is described. Some alternative techniques have also been discussed. Some pictures are inserted to facilitate understanding of the surgical procedure.

The book encompasses Dr Baranski ' s 20 year experience in the field of abdominal organ donation. It is a step-by-step guide with photographs and drawings with clear explanations highlighting pitfalls. The book quickly and easily guides the reader through the difficult steps during organ procurement. It is mainly illustration-based, without much text, and covers surgical technical mistakes and organ damage.

This practical guide provides a full but concise account of the organ donation and transplantation process, from the management of the donor and organ preservation to perioperative management and surgical techniques. Readers will learn about various aspects of multi-organ retrieval such as different types of donors and evaluation of organ donors, as well as the retrieval process itself and ethical aspects of transplantation. Written in a consistent format, each of the themed parts examines the different types of solid organ transplantation, namely kidney, pancreas and liver. Each part discusses the indications for transplantation, organ allocation, surgical technique, post-operative management outcomes and professional skills for the surgeon. This is an essential guide for the transplant surgeon offering a unique summary of the critical issues in abdominal organ transplantation.

Each day, nearly 60 Americans receive a transplanted kidney, liver, or other organ—a literal “second chance at life”—but 11 others die waiting for an organ transplant. The number of donors, although rising, is not growing fast enough to meet the increasing demand. Intended to improve the current system of organ procurement and allocation, the “Final Rule,” a 1998 regulation issued by the U.S. Department of Health and Human Services, sparked further controversy with its attempts to eliminate the apparent geographic disparities in the time an individual must wait for an organ. This book assesses the potential impact of the Final Rule on organ transplantation. It also presents new, original analyses of data, and assesses medical practices, social and economic observations, and other information on: access to transplantation services for low-income populations and racial and ethnic minority groups; organ donation rates; waiting times for transplantation; patient survival rates and organ failure rates leading to retransplantation; and cost of organ transplantation services.

One of the most interesting and at the same time most challenging fields of medicine and surgery has been that of organ donation and transplantation. It is a field that has made tremendous strides during the last few decades through the combined input and efforts of scientists from various specialties. What started as a dream of pioneers has become a reality for the thousands of our patients whose lives can now be saved and improved. However, at the same time, the challenges remain significant and so do the expectations. This book will be a collection of chapters describing these same challenges involved including the ethical, legal, and medical issues in organ donation and the technical and immunological problems the experts are facing involved in the care of these patients. The authors of this book represent a team of true global experts on the topic. In addition to the knowledge shared, the authors provide their personal clinical experience on a variety of different aspects of organ donation and transplantation.

A comprehensive compilation of the majority of surgical procedures in transplant surgery, this book details the latest and most innovative procedures in one reference work. “ Atlas of Organ Transplantation ” is essential reading for all transplant surgeons, residents and fellows, as well as operating room nurses and transplant nurse coordinators.
