Another disc of same mass but half the radius is gently placed over it coaxially. The angular speed of the composite disc will be (IIT 86) (a) (b) (c) (d) Answer: (b) 16. A wheel having a moment of inertia of 2 kg m 2 about its vertical axis, is rotating at the rate of 60 r.p.m. about this axis.

Rotational Motion Questions: Paper – 01

Rotational motion of a rigid body around a fixed axis is a special case of rotational motion. During rotational motion there is also a possibility of axis changing its orientation. We can not explain the concepts of wobbling or precession by using fixed axis hypothesis for rotational motion. Here in this article about rotational motion I am assuming that you are comfortable in describing motion in physics.

Rotational motion : Explanation and examples

Answer: v i = 5.03 m/s and hang time = 1.03 s (except for in sports commercials) See solution below. A bullet leaves a rifle with a muzzle velocity of 521 m/s. While accelerating through the barrel of the rifle, the bullet moves a distance of 0.840 m.

Kinematic Equations: Sample Problems and Solutions - Physics

What of it? Well, the big takeaways about rotational motion are that: 1) It has mathematical analogs in the world of linear or translational motion that make studying either one in the context of the other extremely useful, as it shows how physics itself is "set up"; and 2) the things that set rotational motion apart are very important to learn.
