In Kuich [4] we generalized the Kleene and the Parikh Theorem to l-complete semirings whose natural limit function is compatible with their partial order. In this paper we generalize in the same manner the following language theoretic result: A language is context-free iff it is accepted by a pushdown automaton.

One of the classic areas of mathematics in which semirings arise is the theory of formal languages. A (formal) language is any set of words| nite strings of symbols| taken from a xed nite set, called the alphabet. For example, a, bad and cddd are words over the alphabet fa;b;c;dg, and as such the set fa, bad, cdddg is a language.

In formal language theory, the Chomsky – Sch ü tzenberger enumeration theorem is a theorem derived by Noam Chomsky and Marcel-Paul Sch ü tzenberger about the number of words of a given length generated by an unambiguous context-free grammar.The theorem provides an unexpected link between the theory of formal languages and abstract algebra
