Since it was first published in 1964, Professor Gottfried Bammes' *Die Gestalt des Menschen* has been considered the definitive book for artists learning to draw the human form. Deconstructing the body into its smallest components, Bammes asserts the importance of learning the structure of bones, muscles and parts in order to accurately draw a human figure. Whilst the original German has been sought after in the English speaking world, a translation has been long lamented. Now, for the first time, Bammes' most famous work has been translated by Search Press into the English language. Faithfully reproduced in translation, with over 540 original diagrams, drawings and photographs, and spanning over 500 pages, new and experienced artists can finally drink in the vast knowledge lovingly presented by the late professor.

A hands-on guide to perspective provides exercises designed to make drawing perspective effortless and easy.

Since the "cultural turn" in the 1990s, increasing attention has been paid to ideological concerns and gender issues in relation to translation studies. This volume is a further illustration of this trend and focuses on the intersection of translation theory and practice with ideological constraints and gender issues in a variety of cross-cultural, geographical and historical contexts. The book is divided into three parts, with the first devoted to the health sciences, examining gender bias in medical textbooks, and the language and sociocultural barriers involved in obtaining health services in Morocco. The second part addresses the interaction of the three themes on the representation of gender and the construction of the female image both in diverse narrative texts and the presence of women in the translation of poetic works in Franco's Spain. Finally, Part Three explores editorial policies and translator ethics in relation to feminist writing or translation in the context of Europe with special reference to Italy, and in the world of magazines aimed at a female readership.

(Book). Whether you need a guitar amp, a sound system, a multi-effects unit for a bass guitar, or a keyboard amplifier, *Tipbook Amplifiers and Effects* helps you make a good choice. Enlarged edition of a classic reference features clear directions for drawing horses, dogs, cats, lions, cattle, deer, and other creatures. Covers muscles, skeleton, and full external views. 288 illustrations.

Leonardo's anatomical studies actually set themselves as an ideal meeting point between artistic and scientific interests because the study of the functioning of the body was essential for artistic practice in order to achieve the correct representation of the human figure. For Leonardo, the artistic practice was determined by an inexhaustible desire for knowledge that led him to study the human body through the Vitruvian proportions and through dissection, carried out by the artist with special care over the middle years of the first decade of the sixteenth century. Drawing becomes essential to understand and reproduce the structure of the male and female body, a "wonderful machine" perfectly thought out. The organs are devices and the body is a machine: Man then becomes a further testing ground for mechanical science.

George Brant Bridgman (1865-1943) was a Canadian-American painter, writer, and teacher in the fields of anatomy and figure drawing. Bridgman taught anatomy for artists at the Art Students League of New York for some 45 years. *Constructive Anatomy: Illustrated by George B. Bridgman*. Excellent book of anatomical drawing instruction. Ideal for beginning to intermediate artists, begins with instruction on drawing hands and works its way through the human body giving detailed instruction on how to draw realistic human figures. The drawings that are presented here show the conceptions that have proved simplest and most effective in constructing the human figure. The eye in drawing must follow a line or a plane or a mass. In the process of drawing, this may become a moving line, or a moving plane, or a moving mass. The line, in actual construction, must come first; but as mental construction must precede physical, so the concept of mass must come first, that of plane second, that of line last. Masses of about the same size or proportion are conceived not as masses, but as one mass; those of different proportions, in respect to their movement, are conceived as wedging into each other, or as morticed or interlocking.
