Molarity Definition as Used in Chemistry

Molarity is a unit of concentration, measuring the number of moles of a solute per liter of solution. The strategy for solving molarity problems is fairly simple. This outlines a straightforward method to calculate the molarity of a solution. The key to calculating molarity is to remember the units of molarity (M): moles per liter.

Molarity - definition of molarity by The Free Dictionary

Molarity (M) indicates the number of moles of solute per liter of solution (moles/Liter) and is one of the most common units used to measure the concentration of a solution. Molarity can be used to calculate the volume of solvent or the amount of solute.

Molarity | Definition of Molarity at Dictionary.com

Molarity (M) is defined as the number of moles of a solute in a litre of solution.

Molarity | chemistry | Britannica

Molarity is the concentration of a solution expressed as the number of moles of solute per litre of solution. To get the molarity, you divide the moles of solute by the litres of solution. "Molarity" = "moles of solute"/"litres of solution" For example, a 0.25 mol/L NaOH solution contains 0.25 mol of sodium hydroxide in every litre of solution.

What is molarity? + Example

The molarity of a solution is calculated by taking the moles of solute and dividing by the liters of solution. This is probably easiest to explain with examples. Example #1: Suppose we had 1.00 mole of sucrose (its mass is about 342.3 grams) and proceeded to mix it into some water. It would dissolve and make sugar water.

Also known as molar concentration, molarity is the number of moles of solute (the material dissolved) per liter of solution. The units of molarity are moles per cubic decimeter, written mol dm^{-3} or simply M.

Definition of molarity - Chemistry Dictionary

Molar concentration (also called molarity, amount concentration or substance concentration) is a measure of the concentration of a chemical species, in particular of a solute in a solution, in terms of amount of substance per unit volume of solution. In chemistry, the most commonly used unit for molarity is the number of moles per liter, having the unit symbol mol/L or $\text{mol} \cdot \text{dm}^{-3}$ in SI unit.

Moles and Molarity For acid-base chemistry purposes, it is more appropriate to measure solute concentration in moles, or individual particles (e.g., atoms, molecules), per unit volume rather than mass per unit volume. This is because atoms react with each other in known proportions in a way unrelated to atomic mass.

Molarity is a measurement of the moles in the total volume of the solution, whereas molality is a measurement of the moles in relationship to the mass of the solvent. When water is the solvent and the concentration of the solution is low, these differences can be negligible ($d = 1.00 \text{ g/mL}$).
